Further Information on Davis Tube Recovery (DTR) Test Work – Reported on December 17, 2013

DTR Sizing Test Work

DTR Sizing test work carried out by ALS Minerals Division, Iron Ore Technical Centre (Wangara, Perth, Western Australia) on ten (10) composite samples, spanning the full range of mineralized material from the Xaudum Iron Ore project, plus two non-mineralized units for comparison.

The mineralized unit's composites consisted of five (5) Magnetite Banded Iron Formation (BIF) (MBA Geodomain) composites, four (4) Magnetite Schist (DIM Geodomain) composites, and one (1) partially oxidized (weathered) BIF (MBW Geodomain). The two non-mineralized units produced no magnetic material and results for these are not considered here. The average grades at P80's of 100, 90, 80, 70, 60, and 50 microns for these units is shown in Table 1.

Table 1. Interval averaged grades, mass recoveries, Fe mass recoveries, at various P80 grind sizes for the three mineralized units measured. Also shown is the interval averaged Head grade, combined composite interval length and Mag Sus (magnetite susceptibility) recorded as % magnetics (which stands for the calculated percentage of magnetic material within the unit), mass recovery and Fe mass recovery.

Mineralized Unit (Geodomain)	Mag Sus % Magnetics	Interval (m)	P80 grind size	Mass Recovery %	Fe Mass Recovery %	Fe %	SiO ₂ %	Al ₂ O ₃ %	P %	S %
Magnetite BIF (MBA)	51.5	50.4	Head	-	-	39.39	30.86	0.55	0.008	0.001
			50 microns	43.3	75.5	69.58	2.26	0.39	0.047	0.021
			60 microns	44.1	76.4	69.04	2.78	0.42	0.057	0.030
			70 microns	44.8	77.3	68.51	3.27	0.45	0.068	0.038
			80 microns	45.5	78.1	67.87	3.81	0.47	0.078	0.045

			90 microns	15.0	49.9	65.80	5.21	0.38	0.044	0.009
			100 microns	15.4	51.1	64.97	6.25	0.48	0.056	0.010

Even in the partially oxidized (weathered) MBW Geodomain there is good separation potential at higher than expected Fe mass recoveries given the percentage of magnetic minerals in the material. This suggests that if the material is ground to the natural grain size of the material of around 70-90 microns then the non-magnetic Fe rich material is recovered along with the magnetite. This suggests that in this weathered BIF (MBW) material there could be remnant magnetite cores surrounded by non-magnetic iron minerals, such as martite (hematite pseudomorph after magnetite), and that the whole grain, which is a mixture of magnetite core surrounded by martite, is recovered during the magnetic separation at the “grain size” grind size of between 70-90 microns.

The general trend of the data is to produce excellent concentrate grades between 50 to 100 microns for all mineralized units at good recoveries given the varying degree of original magnetic minerals in the starting material. This means that even the Magnetic Schist (DIM) with a Head grade as low as 15% Fe can be considered ore.

The methodology applied by ALS Mineral division for this DTR sizing test work was to take six splits of each composite, one split is sent for Head grade determination. The other five splits are ground using a mechanical pulverize in a method that simulates plant mill grinding. The ground material is then screened at screen sizes of 500, 300, 212, 150, 106 and 53 microns. The P80 at each screen size is determined mathematically from the amount of material passing each screen size, this process is referred to as sizing DTR test work, and is the best method for determining which grind size is optimal for these samples. The results indicate that these materials grind size is optimal between 60-90 microns, which are considered fairly coarse grinds, a positive factor for the project.

The grades of each sizing concentrate are determined via XRF assay along with the Head and Tails, the results of the sizing work are shown in Appendix 1. The results are then plotted on sizing curve graphs (Appendix 2). From these graphs concentrate grades at specific P80's have been determined (Tables 1 and 2 of the main press release and this document). The breakdown of each composite is shown in Table 2 below at the indicated P80's.

Table 2. The results for each composite, including Head Grade, Concentrate Grade at the stated P80's, mass recoveries, and Fe mass recoveries. Composite 1 and 3 were non-mineralized, contained no magnetic material of note and are not reported.

Composite	Hole ID	Interval (m)	Mineralized Unit (Geodomain)	Mag Sus % Magnetics	Concentrate at P80 grind	Mass Recovery %	Fe Mass Recovery %	Fe %	SiO ₂ %	Al ₂ O ₃ %	P %	S %

About Tsodilo Resources Limited: Tsodilo Resources Limited is an international diamond and metals exploration company engaged in the search for economic diamond and metal deposits at its Newdico (Pty) Limited ("Newdico") and Gcwihaba Resources (Pty) Limited ("Gcwihaba") projects in northwest Botswana. The Company has a 98% stake in Newdico (895 km² under Precious Stone - diamond licenses). The Gcwihaba project area: 2,404 km² under Precious Stone - diamond licenses; 11,158 km² Metal (base, precious, platinum group, and rare earth) licenses; and, 6,925 km² under Radioactive Minerals licenses is 100% held by the Company. Tsodilo manages the exploration of both the Newdico and Gcwihaba license areas. Overall supervision of the Company's exploration program is the responsibility of Dr. Mike de Wit, President and COO of the Company and a "qualified person" as such term is defined in National Instrument 43-101. Dr. de Wit has reviewed the information contained herein and approved the contents of this report. Further to this, the supervision of the Xaudum Iron Ore project is the responsibility of Dr. Alistair Jeffcoate, Chief Geologist and Project Manager for the Company and a "qualified person" as such term is defined in National Instrument 43-101. Dr. Jeffcoate has also reviewed the information contained herein and approved its contents.

National Instrument 43-101 - Standards of Disclosure for Mineral Projects, Form 43-101F1 and Companion Policy 43-101CP requires that the following disclosure be made: All references contained herein with respect to the potential quantity and grade derived by any method is at this stage of development conceptual in nature. At the present time, there has been insufficient exploration to define a mineral resource and it is uncertain if further exploration will result in the target being delineated as a mineral resource.

This report may contain forward-looking statements. All statements, other than statements of historical fact, that address activities, events or developments that the Company believes, expects or anticipates will or may occur in the future (including, without limitation, statements relating to the development of the Company's projects) are forward-looking statements. These forward-looking statements reflect the current expectations or beliefs of the Company based on information currently available to the Company. Forward-looking statements are subject to a number of risks and uncertainties that may cause the actual results of the Company to differ materially from those discussed in the forward-looking statements, and even if such actual results are realized or substantially realized, there can be no assurance that they will have the expected consequences to, or effects on the Company. Factors that could cause actual results or events to differ materially from current expectations include, among other things, changes in equity markets, political developments in Botswana and surrounding countries, changes to regulations affecting the Company's activities, uncertainties relating to the availability and costs of financing needed in the future, the uncertainties involved in interpreting exploration results and the other risks involved in the mineral exploration business. Any forward-looking statement speaks only as of the date on which it is made and, except as may be required by applicable securities laws, the Company disclaims any intent or obligation to update any forward-looking statement, whether as a result of new information, future events or results or otherwise. Although the Company believes that the assumptions inherent in the forward-looking statements are reasonable, forward-looking statements are not guarantees of future performance and accordingly undue reliance should not be put on such statements due to the inherent uncertainty therein.

The TSX Venture Exchange has not reviewed and does not accept responsibility for the adequacy or accuracy of this report.
